Option Matrix

	Use of leased lines	Use a new SBC in the internet facing zone
Security	● Private connection assumed secure as media and signaling traffic is tunneled ● Small exposure to public internet, mainly the tunnel ● Tunnel needs monitoring	● Public-facing SBC ● IP whitelisting can restrict access ● Follows standard security practices
Latency	● SIP/TCP may pass through a forward TCP proxy ● SIP/UDP and RTP will need to be passed directly to the tunnel ● Risk that the tunnel is a single point of failure. ● Tunnel capacity needs to be guaranteed across the internet ● Latency, jitter, or packet loss can emerge if the tunnel is underperforming	● Direct internet-based connection ● Lower risk of call quality degradation because Daily has several points of presence in Asia ○ Singapore ○ Hong Kong ○ South Korea ○ Sydney ○ India
Cost	● Cost of leased line setup ● Recurring cost for line maintenance ● Higher cost if tunnel redundancy needed ● (Possibly) New SBC to forward from Avaya to Daily	● One-time cost for SBC hardware and setup ● Licensing is perpetual but requires renewal/maintenance fees ● Lower operational expense compared to leased line setup
Operational Feasibility	● Tunnel needs ongoing maintenance ● Coordination with multiple parties ● More complex to scale ● May require a new SBC to forward the connection from the leased line to Daily ● Depends on existing network topology and equipment	● Aligns with typical Avaya deployments ● Easier to maintain long term ● Faster to troubleshoot ● Direct integration path ● Fewer moving parts operationally
Scalability and Reliability	● Single point of failure if the tunnel crashes. The ongoing calls will immediately disconnect. ● Latency, jitter, or packet loss can emerge if the tunnel is underperforming ● Scaling depends on proxy and leased line bandwidth	● SBC is designed for high concurrency ● More resilient under load ● Easier to scale horizontally
